Assembly instruction

Tip!

Stick one Powerstrip on an invisible piece of wall. Leave it there for at least fifteen minutes and then remove the Powerstrip. Use this to test that the strip does not come off too easily and whether this happens without damage.

A Powerstrip only adheres to a clean and firm/non-porous surface.

Step 1

Hold the mould against the wall and place the strips in the recesses. Press each part of the strip for 5 seconds. **Do not rub it.**

Pay attention!

Do you have a textured wall? Then massage the strips well into the texture of the wall with 1 finger.

Step 2.1

1. Stick the magnet horizontally with the white side against the red line of the strip.

2. Click the thin white plate against the magnet and then remove the protective layer.

Step 2.2

Now stick the first wall element against the two white plates. Make sure that the white plates are in the middle.

Step 3

Remove the wall element from the wall again and press the white plates well (especially the edges and corners) and then click the wall element back. Et voilà, your first wall element is hanging.

Step 4

Use the mounting template again to stick the strips for your next wall element(s). Repeat step 2 and now use the spacer in step 3 to get the same spacing everywhere.

Removal

Grab the tab and pull it up the wall. Hold the magnet with your other hand so that it doesn't slip away. Do this **slowly** and **carefully**.
